

Project report

Artificial intelligence and digital footprints

Supervisor: Anhar A. Haneef

Student Name	ID Number	Group
Manar Turki Ahmed	445006780	10
Atheer Salem Alfahmi	443001237	10
Layan Abdullah Alshreef	44610583	10
Khlood Hamed Almasoudi	445002504	10
Ghala Adel Alghamdi	44610860	10

Introduction

In our project on *Artificial Intelligence and Digital Footprints*, we explained to the audience what privacy and digital footprints mean, and how they are formed through the information we share online every day. We talked about how AI can predict people's behavior based on the data it collects about them, and how this affects both individuals and their privacy.

We also discussed how companies today see data as the “new oil”, using it as a major source of profit and development in a world that now runs on data. Finally, we explained the risks of data leaks and hacking, what could happen when users' personal information is exposed, and how digital footprints are connected to identity theft and online fraud.

Topic assigned and why does it matter?

We talked about the topic of digital footprint and digital identity with artificial intelligence and privacy. It is very important because artificial intelligence is present in every part of our daily lives, and we all have a footprint and digital identity whether we are aware of how it was formed or not.

Everyone uses social media to post and follow, and use AI tools to make tasks and work easier and for many other things. Therefore, generative and assistant AI tools have a lot of information about us, and sometimes even personal information. So, it is important to keep our personal and sensitive information away from them, because a single breach of our accounts in AI tools can lead to the breach of our personal accounts and social media accounts and cause big harm to us.

Short reflection paragraph from each student

Student 1: Manar Turki

What did you personally contribute?

I designed the stickers, the presentation, and the theme. Also, in the booth, I talked about possible alternative scenarios — what if the hacker did not just hack one person's AI tool account but hacked the whole company? How much damage could that cause — theft, hacking, impersonation, blackmail, spying, and many more. And how we can protect our data and information by paying attention to the information we give to AI tools, because once the information is given, it is stored and cannot be deleted. Also, by controlling access and permissions.

What did you learn from the experience?

I learned and enjoyed this project a lot. I learned how the digital footprint is formed, what it is, and the importance of paying attention to it and protecting it. I also learned how AI collects a lot of information about us, and that even small pieces of information can come together to form a big piece of data. I learned the importance of protecting our privacy and information and reporting to the authorities if something happens.

Student 2: Atheer Alfahmi

What did you personally contribute?

I helped explain the main ideas about privacy, digital footprints, and how AI uses data to predict behavior in a simple and clear way for the audience. I also participated in preparing examples and explanations that showed how small pieces of information can form a digital identity. In addition, I contributed to discussing the risks of data leaks and identity theft, and how people can protect their personal information online.

What did I learn from the experience?

From this experience, I learned how powerful data can be and how easily it can reveal personal details about someone. I also understood that AI depends heavily on user data, and while it can be useful, it also raises serious privacy and security concerns. Most importantly, I learned how to communicate complex topics like AI and data privacy in a simple, engaging way, and how awareness can help others protect themselves in the digital world.

Student 3: Layan Abdullah Alshreef

What did you personally contribute?

I prepared this Educational Handout (Flyer) for Privacy and Digital Footprint. In the flyer, I explained the meaning of privacy and how it relates to our digital footprint, highlighting how our online actions such as posting, searching, or sharing can affect personal information. I also discussed practical ways to protect privacy, including using strong passwords and two-step verification. In addition, I added the official emergency reporting methods for online blackmail in Saudi Arabia, such as the **كلنا امن** app, the Saudi Authority for Cybersecurity, and the emergency number 911. All the written content and organization of the flyer were done by me.

What did I learn from the experience?

Through this experience, I learned how powerful and important our digital footprint can be, and how easily our privacy can be affected by what we share online. I also improved my skills in digital design, research, and communication. Most importantly, I realized that spreading awareness about online safety can truly help others stay protected. This project taught me how to turn technical information into something creative and meaningful that can make a real impact.

Student 4: Khlood Hamed Almasoudi

What did you personally contribute?

My core contribution was presenting the second part of the topic. Where I transformed the abstract Digital Footprint concept into a relatable blackmail scenario involving an AI tool. I drafted this compelling narrative to emotionally connect with the audience and demonstrate the immediate, personal consequences of data sharing errors. Beyond content delivery, I dedicated time to quality assurance, offering feedback and review on teammates' content to ensure maximum coherence. I also managed the operational logistics for the booth, overseeing the provision of hospitality items (coffee and chocolate) to ensure a comfortable atmosphere for our visitors.

What did I learn from the experience?

I personally enjoyed working on this project, which served as a significant eye-opener, especially as I was previously sharing personal details with ChatGPT without realizing the risks. I learned a crucial lesson about communication: people absorb information faster through narrative and storytelling. The visible concern on the audience's faces, despite the story being fictional, proved that emotional engagement is far more powerful than theoretical facts. Beyond communication, I realized the sheer scale of the problem; the threat to our data is far larger than we, as individuals, perceive. Maintaining vigilance to protect our digital lives is no longer optional; it is essential.

Student 5: Ghala Adel Alghamdi

What did you personally contribute?

I was responsible for designing the interactive game for the booth. I created the idea and prepared all the materials for the game, making sure it explained AI and digital privacy in a fun and easy-to-understand way.

During the event, I ran the game for visitors, explained each step, and helped them understand how digital footprints are formed and how

data can affect their privacy. I also helped organize the booth, ensuring the activity ran smoothly and giving visitors an enjoyable and interactive experience.

What did I learn from the experience

learned how AI can affect our privacy and how our digital footprint is formed from what we do online. I also learned how to explain technical ideas simply for everyone and how to work with a team to organize a clear and engaging booth. In addition, I discovered the value of interacting directly with visitors and how hands-on activities can make learning more fun and meaningful

Conclusion:

In summary, AI and data collection make our digital footprints more powerful and risky than before. Even small details can build a full profile that others can use for profit or harm.

We encourage everyone to limit unnecessary app permissions, avoid sharing personal details, and use privacy tools and security features. The activity helps show how little information is needed to identify someone. Finally, if personal data is leaked or used for blackmail, people should stop sharing information, keep evidence, and contact the right authorities or support teams. Understanding how digital footprints work is the first step to staying safe in the AI-driven world.

Educational Handout (flyer):

PRIVACY & DIGITAL FOOTPRINT

Privacy means protecting your personal information, while your digital footprint is everything you do online like what you post, search, or share. They are connected because what you share affects your privacy. That's why it's important to think before you post or share anything online. Being careful helps you stay safe and maintain control over your personal data.

Using strong passwords and two-step verification helps protect your privacy, while searching for something on Google leaves a digital footprint. Never try to deal with the blackmailer yourself always report through official channels to stay safe.

Reporting online Blackmail

- ✓ تطبيق (كلنا أمن) يمكنك من خلاله تقديم بلاغ عن الابتزاز او الجرائم الإلكترونية
- ✓ منصة أبشر الدخول للخدمات الامن العام ثم اختيار بلاغات الجرائم الإلكترونية
- ✓ الهيئة السعودية للأمن السبراني
- ✓ الاتصال برقم الطوارئ للبلاغات العاجلة 911

If someone faces online blackmail, it's important to report it to the official authorities immediately. Saudi Arabia provides secure and easy ways to report cybercrimes.

Digital Shadow Team
